

*Collecting knowledge is good.
Sharing it is even better.*

INFORMATION

Browser-based access to all network and infrastructure object data

VISUALISATION

Cross-sector network representation with map services

MEDIA ACCESS

Direct display of linked photos, videos and documents

REPORT OUTPUT

Export of graphics, longitudinal sections and defined reports

ONLINE GIS INFORMATION

You need to give your employees unrestricted access to current infrastructure data at all times? From various places, using different devices? Then BaSYS WEB is the right solution for you! This application allows you to bring the functionality and scalability of BaSYS desktop solutions seamlessly into the Intranet and Internet. After a one-time installation, all of your inventory data are available to a broad group of users – but only with authorisation. BaSYS WEB delivers the highest performance with ultimate ease of use, both on the PC and on mobile devices.

ADVANTAGES

- Access to geographic base and technical data on any device using a standard browser
- Intuitive, self-explanatory and easy operation
- The data in their current state are always accessible via the spatial BaSYS geodata server
- You work with the established BaSYS user interface
- Manageable investment costs – no additional client software required

SYSTEM

BaSYS WEB is based fully on common web standards such as HTML5 and AJAX. A standard browser is used to access BaSYS WEB. No add-ons have to be installed. This greatly simplifies data access, especially for sporadic applications such as information stations. Different IT environments no longer play a role for the information station. The investment costs for the required software licenses are manageable.

DATA POOL

The map services access the spatial BaSYS geodata server directly as needed. Thus all web applications display the current state of geographic base and technical data at all times. Changes are displayed on all workstations immediately, regardless of whether they are made through the web or desktop workstations.

FORMS

The linked forms for navigation in table and hierarchical form familiar from the BaSYS desktop solution are found in BaSYS WEB. Map services configuration is automated based on the representation models available for the BaSYS desktop applications. The appearance on the web corresponds 1:1 to the desktop application.

This applies for plan design as well as reporting. All forms and layouts created with the BaSYS Arena Designer can also be published on the web.

CONFIGURATION

The BaSYS WEB services integrate seamlessly into the portal solutions of the leading mapping servers such as ArcMap from Esri, Infrastructure Map Server from Autodesk, Map-Guide Open Source and QGIS Server. Administrative effort is minimised since the configuration of data access and network representation is fully automated.

EXTENSIVE TECHNICAL FUNCTIONALITY

BaSYS WEB encompasses the extensive BaSYS technical functions including network tracing with various termination criteria, freely definable longitudinal sections and inspection and rehabilitation graphics with interactive video and image control to view specific damage.

The BaSYS WEB services are also available for user-defined geo-objects and for the applications created with GeoDS. BaSYS WEB is complemented by the standard map services of various providers such as Google Maps, Bing and ArcGIS online.

INDIVIDUAL SOLUTIONS

Complex tasks demand unique solutions. We work with you to develop a concept in order to adapt our products to your individual needs for efficient application. The BARTHAUER consulting team offers advice, training and support from the first meeting to smooth operation in your company.

BaSYS WEB SERVICES

BaSYS WEB base package with extensions for special fields:

- Sewer
- Water/gas/cable
- Street
- Operation management
- Individual cadastres
- And much more...
